## Docker Assignment – 4

### Data Persistence using Docker Volume

- By Swapnil Jadhav

An organization XYZ Private Limited has recently transformed their IT application from Monolithic to Microservice Architecture. The organization has started using Docker as a Containerization technology to deploy their application as containers.

While working with containers, organization has observed that as the containers gets destroyed, the data get lost. After investigation, the organization has figured out that the container data needs to be persisted using Docker Volume.

The organization has request you to implement same. You are required to do following tasks :

1. Create a Docker Volume.
2. Launch an Ubuntu container by mounting the created volume.
3. Attach the terminal to the running ubuntu container.
4. Create some dummy files into the persisted directory.
5. Exit from the Container
6. Stop the container.
7. Verify that the files created in container are available in Docker volume.
